SAN FRANCISCO AND SACRAMENTO.

1884.

SACRAMENTO:

Press of H. S. Crocker & Co.

TO OUR PATRONS.

We are pleased to present you with our Illustrated Catalogue for 1884.

Our patrons found our former Catalogue of so much assistance in making their selections that we have been encouraged to go somewhat more into details than formerly. While we believe we have so clearly illustrated and explained the principal Hardware used on this coast that no difficulty will be experienced in making selections, we regret not being able to be equally definite as to prices; the numerous and constant market changes make it impossible to furnish prices that may be relied on for any length of time. We stand ready, however, to furnish latest quotations upon application.

At the end of our Catalogue will be found a number of Telegraph Ciphers that will effect quite a saving when occasion requires your telegraphing for goods. There are also some well selected tables of useful information.

Kindly acknowledge receipt of this Catalogue.

HUNTINGTON, HOPKINS & CO.

--	----

CRESCENT EXTRA.—Special for Lathe, Planer and Slotter Tools, Taps, Punches, etc. Add 1 cent per lb. to refined.

Crescent, like all fine steels, to give satisfactory results, should be worked at as low a heat as possible, with a good supply of fuel and a very gentle blast, and hardened at a very low cherry red.

MACHINERY QUALITY.

Round, $\frac{1}{2}$ to 2 inches..... Cts. per lb.

Size, inches.	ROUND.	Cts. per lb. Extra.

$4\frac{1}{8}$ to 5 "		06
$5\frac{1}{8}$ to 6 "		09

MISCELLANEOUS.

	Cts. per lb.
Toe Calk	
Tire	
Plow.....	
Spring.....	
Spring, $\frac{1}{8}$ inch thick.....	
Hammered German.....	
Saw Plate. No. 26 gauge to 3 16 in. thick.....	

Naylor's—English.

Best Cast Tool; all the leading sizes of Flat, Octagon, Round and Square.

Round, Square and Octagon, $\frac{1}{2}$ to 2; Flat, $\frac{3}{8}$ to 1 by $\frac{1}{2}$ to 4 inch. Cts. per lb.
Extra sizes advance same as Crescent.

Firth's—English.

Best Cast Tool; all the leading sizes of Octagon.

Best Cast Tool, Octagon, $\frac{1}{2}$ to 2..... Cts. per lb.
Best Cast Tool, Quarter Octagon, $\frac{3}{4}$ and $\frac{7}{8}$ for granite drills and chisels .. " "

Mushet's—English.

Special, for Lathe and Planer Tools Cts. per lb.

We are agents for the Pacific Coast, for the "OTIS STEEL," and can also furnish, on specification, BOILER HEAD, BOILER PLATE, and SMOKE STACK STEEL, cut to dimensions.

IRON.

Refined.

In addition to the above, we carry in stock Plate Iron, C. No. 1 and CH No. 1, Nos. 11 and 10, 3-16, 1/4 5-16 and 3/8 inch thick, all ordinary widths and lengths

Any other sizes furnished to order, shipments being made from the East by Rail or Steamer.

CORRUGATED SHEET IRON.

For Covering the Roofs and Sides of Buildings.

CORRUGATED SHEET IRON has the following qualities, essential to all covering material :

It is Fire, Lightning, Water and Wind Proof.

It is the strongest known form of Sheet Iron, and imparts material strength to the structure to which it is attached by its lineal rigidity.

It allows for the use of a light frame, being a support in itself.

A building covered with it makes a handsome appearance.

Every corrugation is a channel in itself, carrying off the water quickly--not allowing it to remain and rust the roof.

It provides for contraction and expansion without warping or displacing the sheet

There is no solder to crack off with the heat, as on tin.

It is the cheapest covering, considering its lasting qualities.

It never wears out, if kept properly painted.

It is easier to put on than any other metal covering : any one who can drive a nail can attach it.

It can be readily taken off and moved from one building to another.

Corrugated Iron is used for Roofs and Sides of Buildings. It is usually laid directly upon the purlins of Roofs, and held in place by Nails.

The corrugations are made of various sizes, ranging from $1\frac{1}{4}$ inch to 5 inches wide, from center to center, and $\frac{3}{8}$ to 1 inch deep. The size of corrugations manufactured by us is a medium one ($3\frac{1}{2}$ wide, $\frac{5}{8}$ deep), which is more pleasing to the eye, and more economical than larger corrugations. The size of sheets we generally use are 22 and 24 gauge thick, 24, 30 and 36 inches wide, and 6, 7 and 8 feet long, although other gauges and lengths can be corrugated when desired.

Perhaps the most convenient sized sheets to use are 30 inches in width, which, allowing for corrugations and laps, will cover about 24 inches of the surface of the roof.

One corrugation is allowed for lap in the width of the sheet, and from 4 to 6 inches in the length, according to pitch of roof.

By one corrugation is meant the double curve between corresponding points ; and by depth of corrugation, the greatest deviation from the straight line measured between the concave surfaces of the corrugated sheets.

Corrugated and Curved Sheet Iron.

For Ceilings in Fire-Proof Buildings.

The curved corrugated iron rests on the lower flanges of the beams, the space being filled with CONCRETE, to or above the top of the beams, as desired. The principal merits of this style of Ceiling are: STRENGTH, LIGHTNESS, CHEAPNESS, and its FIRE-PROOF QUALITIES.

These arches have often been tested, and have never shown any deflection at a load of 1,000 lbs. per square foot, and very little deflection at 2,000 or 3,000 lbs. per square foot.

Showing Curved Sheet in place in ceiling of a fire-proof Building.

Table giving Sizes and Weights of Corrugated Iron for Roofs and Sides of Buildings, calculated for sheets 30 inches wide before corrugation:

Number by Birmingham Gage.	Thickness in parts of an inch.	Weight per Square Foot.		Weight per square (100 Square Feet), when laid, allowing 6 inches lap in length, and 34 inches, or one corrugation in width of sheet. For sheets the following lengths.		
		Flat.	Corrugated.	6 Feet.	7 Feet.	8 Feet.
		Lbs.	Lbs.

CUMBERLAND COAL.

This article we import by the cargo from the Jackson Vein, Georges Creek Mine, which is acknowledged to be the best that comes to this market. We deal in no other kind of coal, so purchasers can depend on getting a pure article. WE GUARANTEE ALL OUR COAL TO BE FIRST CLASS. It is stored under cover in our brick warehouse, and consequently the quality is not impaired by exposure.

DIES

For Little Giant Screw Plate.

Die in Collet.

A represents the Die, which is in two pieces, each piece is held in place and adjusted by the screws, CC. B represents the Collet. It will be seen that the holes for the screws in the Collet (B) are opposite, but the holes in the Die are NOT opposite and are larger than the point of the screw, so that one screw holds the Die from moving forward and the other from moving backward, both screws impinge on the lower side of the holes, so that when both screws are tight they prevent the Die from moving. In this way we make use of the screw and wedge; it is doubtful if there can be a more simple and secure way of holding and adjusting Dies. To adjust the Die, loosen one screw and tighten the other, according to the direction it is desired to move it.

		1 3/4 inches wide, 4 1/2 inches long, 3/8 inch hole.					

No. 750

A detailed illustration of a Wagon Circle, a circular metal component with a central hub and four spokes, shown in two overlapping views. The component is made of dark metal and features a central circular hole. The spokes are arranged in a cross pattern, with each spoke having a small rectangular cutout near the outer rim. The overall design is symmetrical and robust, typical of heavy-duty agricultural machinery.

Cross-cut Saws have heretofore been ground in a straight line, from end to end, as shown by broken lines in Fig. 1. As a result, a saw made 14 gauge thick at the center of the edge of the saw, and beveled to 18 gauge at the back, will be but 16 gauge thick at the edge, near the end of the saw; or, in other words, THE TEETH VARY TWO GAUGES IN THICKNESS ON THE EDGE OF SAW, as shown in diagram.

The improvement consists in grinding the saw in crescent lines, parallel or substantially parallel to the cutting edge, as shown in Fig. 2, in which case THE EDGE OR TEETH ARE OF EVEN THICKNESS, while the inequality is thrown into the back, and the thickness of the saw remaining the same across its center as when ground the old way, THE ENDS ARE INCREASED TWO GAUGES IN THICKNESS.

PLUMBS AND LEVELS.

Sectional drawing and description of Patent Improved Adjustable Plumb and Level.

The Spirit-glass (or bubble tube), in the Level, is set in a Metallic Case, which is attached to the Brass Top-plate above it—at one end by a substantial hinge, and at the opposite end by an Adjusting Screw, which passes down through a flange on the Metallic Case. Between this flange and the Top-plate above, is inserted a stiff spiral spring, and by driving or slackening the Adjusting Screw, should occasion require, the Spirit-glass can be instantly adjusted to a position parallel with the base of the Level.

The Spirit-glass in the Plumb is likewise set in a Metallic Case, attached to the Brass Top-plate at its outer end. By the use of the Adjusting Screw at the lower end of the Top-plate, the Plumb-glass can be as readily adjusted to a right angle with the base of the Level, if occasion requires, and by the same method as adopted for the Level-glass.

WIRE STRETCHERS.

Samson.

For stretching wire, pass the end of rope around the post and secure with hook; place wire in clamp on machine.

For splicing, place one wire in clamp on end of rope about two feet from its end, and place the other wire in clamp on machine.

To loosen the stretcher after tightening the wire, simply invert it without letting go the handles, and tighten enough to let the pawl drop from the ratchet—then let go the handles

How to Use the Cipher.

Follow the line on which is the number of kegs wanted until you come under the desired size; the word at the junction denotes the quantity and size you wish to order. If Finishing Nails are wanted, add the word "Finishing" after the Cipher word denoting size and quantity. The same rule applies to Fence, Box, Casing, or Fine Nails. Thus: To order 1 keg 3d fine, 3 kegs 6d nails, 5 kegs 12d Fence, 15 kegs 20d Nails, and 2 kegs 30d Nails, the telegram should read, Wabble fine, Waltz, Whack fence, Yacht, Watson.

Rule for Finding Weight of Flat Iron.

Multiply width by thickness, divide by 3 and multiply by 10. Thus, for 2 by $\frac{3}{4}$. $2 \times \frac{3}{4} = \frac{3}{2} \div 3 = \frac{1}{2} \times 10 = 5$, the approximate weight per foot.

WEIGHT OF SQUARE BAR IRON.

For Steel, multiply tabular number above (for size) by 1.01.

Rule for Finding Weight of Square Iron.

Square the diameter, divide by 3, and multiply by 10. Thus, for 2 inch square: The square of 2 is 4 divided by 3 is $1\frac{1}{3}$, multiplied by 10 equals $13\frac{1}{3}$, the approximate weight per foot.

WEIGHT AND STRENGTH OF WIRE ROPES.

Showing approximately the comparative strength, sizes and weights per 100 feet in length, of Iron Wire Rope, Steel Wire Rope, Hemp Rope and Chain.

The sizes on each horizontal line are of equal strength.

Capacity of the Ropes and Chain. Working Load, lbs.	Breaking Strain, tons.	Round Charcoal Iron Wire Rope. Circum. in.	Round Crucible Steel Wire Rope. Circum. in.	Round Hemp Rope. Circum. in.	Flat Charcoal Wire Rope. Size in ins. width, thickness.	Flat Crucible Steel Wire Rope. Size in ins. width, thickness.	Iron Chain. Link, Diam.	Weight per 100 feet.

Pressure of Water per Square Inch for Different Heights.

To compute the pressure per square inch of a column of water, multiply the head in feet by .434. Example: 100 feet head, 100 X .434 = 43.31 pounds pressure per square inch.

BELTING.

Horse-power of a belt equals velocity in feet per minute, multiplied by the width—the sum divided by 1000.

One inch single belt moving at 1000 feet per minute equals 1 horse-power.

Double belts about 700 feet per minute, per 1 inch width, equals 1 horse-power.

For double belts of great length, over large pulleys, allow about 500 feet per minute per 1 inch of width per horse-power.

Power should be communicated through the lower running side of a belt; the upper side to carry the slack.

Average breaking weight of a belt 3-16x1 inch wide—Leather, 530 pounds; 3 ply rubber, 600 pounds.

The strength of a belt increases directly as its width. The co efficient of safety for a laced belt is: Leather equals 1-16 breaking weight; Rubber equals $\frac{1}{8}$ breaking weight.

To find Length of Belting when closely rolled.

The sum of the diameters of the roll and the eye in inches, multiplied by the number of turns made by the belt, and this product multiplied by the decimal .1309 will equal length of the belt in feet.

GRINDSTONES.

To find the Weight.

Square the diameter (in inches), multiply by thickness (in inches), then multiply by decimal .06363.

EXAMPLE.—Find the weight of a stone 4 feet 6 inches in diameter and 7 inches thick. 4 feet 6 inches = 54 inches; square of 54 = 2,916; multiplied by 7 = 20,412; multiplied by .06363 = Ans., 1,298 815 lbs., which is weight of stone.

To find the circumference of a circle, the diameter being given: Multiply the diameter by 3.1416.

To find the diameter of a circle, the circumference being given: Divide the circumference by 3.1416.

To find the area of a circle, the diameter being given: Multiply the square of the diameter by .7854.

To find the area of a circle, the diameter and circumference both being given: Multiply the diameter and circumference together, and divide the product by 4.

To find the cubic contents of a cylinder, the diameter and length being given: Multiply the square of the diameter by .7854, and the product by the length.

TO TEST IRON AND STEEL.

A medium even grain with fibres denotes good iron.

A soft, tough iron, if broken gradually, gives long silky fibres of leaden gray hue, which twist together and cohere before breaking.

Badly refined iron gives a short, blackish fibre on fracture. A very fine grain denotes hard, steely iron, likely to be cold-short and hard.

Coarse grain, with bright crystallized fracture or discolored spots, indicate cold-short, brittle iron, which works easily when heated, and welds well. Cracks on the edge of a bar are indications of hot-short iron.

Good iron is readily heated, is soft under the hammer and throws out few sparks.

Good steel, in its soft state, has a curved fracture and a uniform gray lustre ; in its hard state, a dull, silvery, uniform white. Cracks, threads or sparkling particles denote bad quality.

Good steel will not bear a white heat without falling to pieces, and will crumble under the hammer at a bright red heat, while at a middling heat it may be drawn out under the hammer to a fine point. Care should be taken that before attempting to draw it out to a point, the fracture is not concave, and should it be so, the end should be filed to an obtuse point before operating. Steel should be drawn out to a fine point and plunged into cold water ; the fractured point should scratch glass.

To test its toughness, place a fragment on a block of cast iron, if good it will be driven by the blow of a hammer into the cast iron ; if poor, it will crush under the blow.

Nitric acid will produce a black spot on steel ; the darker the spot the harder the steel. Iron, on the contrary, remains bright if touched with nitric acid.

To restore burnt iron. Give a smart heat, protected from the air ; if injured by COLD HAMMERING, anneal slowly and moderately ; if HARD or STEELY, give one or more smart heats to extract the carbon.

TO PROTECT IRON AND STEEL FROM RUST.

Prof. F. Grace Calvert, of England, has discovered that the carbonates of potash and soda possess the same property of protecting iron and steel from rust as do those alkalies in a caustic state. If an iron blade is half immersed in a solution of either of the above named carbonates, it exerts so protective an action that that portion of the iron which is exposed to the influence of the damp atmosphere does not oxidize, even after a period of two years.

Similar results have been obtained with sea water to which have been added the carbonates of potash or soda. The applications of this fact are numerous and important.
